Hi.

first of all, thanks for your answers...

- This server IS member of a domain.
- I AM the admin for this domain
- This domain is Testing / pre-production site containing :
 - 1 AD controler
 - 1 SQL 2k 8.00.655 2 nodes cluster
 - 1 biztalk 2002 server
 - 1 IIS 5.0 web server (will be NLB clustered for prod.)
(with .Net FrameWork SP2)
 - 1 StandAlone root CA
 - 1 StandAlone AE

All servers running Win2K with SP3 and a few post SP3 hotfixes (like the Q323172 for the PKI ;-)

There is no group policy
But There is a domain wide security policy for service accounts as described in "setting up a service account" doc. for BizTalk, SQL, cluster service

I've already tested to force a propagation using
`secedit /refreshpolicy machine_policy`
After a few hours, IIS is still working fine. But after a day or two : -= Access Denied =- with a system log full of W3SVC : Warning : the user doesn't have the requested logon type (3) permission (something like that)...

I cleared the "Allow IIS to control password" and it SEEMS to works better... but.. for how many days ?

I'll post another message if it crashes again.

Thanks !
