Good Day Everyone,

I have a strange question.

I am running IIS 5.0 on a windows 2K Pro box. The W2K Pro box has access to active directory, active directory contains all of the user accounts. I have IIS security set to INTEGRATED. anonymous access is denied. File system is NTFS – anonymous access here is denied too.

When a user hits the web site they get a login prompt and enter thier name, password, and domain. all is good so far.

The problem starts here...

There are some pages within the website that need to be restricted to only certian users of the domain. When a user who should not et access to this page clicks on the link for it they get a password prompt again, if they enter thier crudentials again they will be denied – this is good!, but if they leave the password, userid and dmoain blank and hit enter the page opens.. Why does this happen?

If you can help me, or would require any further information please email me directly at [Rob\\_carey\\*NOSMAP\\_PLEASE\\*@gov.nt.ca](mailto:Rob_carey*NOSMAP_PLEASE*@gov.nt.ca)..

Thank you
