Hi Stephan,

Q306460 hasn't been updated to include references to the later patches, my apologies.

The only way to know how to interpret the output for those patches is double-checking the security bulletin for which you are being alerted. The bulletin will give you information on what is required for patching and how to verify installation (assuming a patch and not a configuration change). For example, we know (both from the original bulletin and Q306460) that MS01-022 has multiple versions of msdaipp.dll considered "appropriate", but the xml file cannot check against all the versions, so we get a Note message. Checking the FAQ section of the bulletin reveals that there are three affected versions of msdaipp.dll. If you have one of the affected versions, you need to apply the patch, if not you're ok (the default install of Windows 2000 installs an affected version, btw).

See Above (SP3 does NOT patch this).

This looks like you have IE 6 SP1 installed. If so, your output is correct
and you are patched.

Again, multiple products with multiple patches, refer to MS02-053 to see if
you have applied the appropriate patch or if you even need to patch. (This
one gives a Note even if you don't have Front Page extensions installed).
