Hank,

It sounds like the admin ID was placed into the "Web Anonymous Users" group and that the logon locally right was removed. Can you manage the server remotely (i.e. run the Management Console from another system and right-click "Computer Management", then select "Connect to another computer")? If so, you can remove the admin ID from the Web Anonymous Users group (and the Web Applications Group, if it's there) and that should take care of you. I ran into this issue with an ID that was being used for a website configured prior to lockdown and requiring authenticated access. The lockdown process removed the "Logon Locally" right from the account (and the Web Anonymous Users" group), yielding precisely the symptoms you've encountered.

**Note...That system was an aberration, the symptoms did not occur on other systems.

HTH,
Charlie

Thanks Richard! I am logging on as admin and it goes into applying settings -> to saving settings then back to the ctrl-alt-del login screen. I am sure the permissions have been changed, but to what degree to not allow me to log in I do not know. IISLockdown was supposed to lock certain users, but the admin? Well I am at a loss. I do not know how to get in? Any suggestions? I have tried to use last good config, safe mode to no avail. I need a real MCSE (which I am not, just a developer pushed into that role). Well crap...any suggestions, websites tools etc would be greatly appreciated.

Hank
