Ok. not sure if I got you right this time.
Say, you have 2 folders. outgoing and incoming
both under E:\inetpub\ftproot\

and you want to have anonymous access together
with IP restricted 'intftp' login access, right ?

anonymous and intftp access write is different, like
you've mentioned.

Ok. in this case, in your first try you are doing this correctly.
because you have both user's NTFS permission correctly figured out.
one thing i guess you don't need is the 'intftp' virtual directory.

what you need is to create 2 ftp sites.
say site1 -> anonymous access -> e:\inetpub\ftproot\
this site restrict only that is NOT from 172.16.x.x and use anonymous

site2 -> intftp access -> e:\inetpub\ftproot\
this site only ALLOW login from network coming from 172.16.x.x and need
auth.

I believe you got the permission setup correctly, it's only
the ftp IP restriction and the authentication.
IP restriction will work if you configure correctly.

side note: the above can be done using one site too. e.g. with 2
different virtual directory serve as the access channel when user
coming. same concept but using virtual directory method.
