>From what you have said:

- no use of "non-blessed" components
- straight asp
- developed (and remotely tested?) at high isolation
- runs but loses application state each few hours

I am guessing

- they have issue with their supplied components, or simply do not know how to config backside accounts for high isolation
- they have your application defined to be scrubbed after X hours of inactivity

Try hitting it to start the app, then exercise each 30 minutes or so to keep it from getting scrubbed by IIS and see if that is it.
