Thanks for the reply.

i had some more questions on this .

let me just tell my scenario in short.

i have a asp page that instantiates a vb com dll.

that dll instantiates Microsoft word.

(i know automating office like this is not recommended)

now our client do not want to be logged on to the web server .

so i am trying to use 'the user' option in dcomcnfg.exe for 'Microsoft word document' properties.

if i give some domain user who is administrator on the web server as well, everything works fine.

now i tried to use a different user who is also domain user but not a administrator on the webserver.this user can not even do 'iisreset' on web server.

i start getting following error

1)Microsoft Word(5097):There is insufficient memory. Save the document now

And if i refresh asp page again i get this error

2)Microsoft Word(5981):Could not open macro storage

i have already tried following

#)run dcomcnfg.exe,for properties for microsoft word document,on security tab

'use custom access permission' i have added this domain user(not a administrator one)and selected 'allow access'.

i have done the same thing for 'use custom launch permission' and 'use custom configuration permission'.

none of this fixes the problem.

RE: dcomcnfg.exe interactive user vs launching user

microsoft.public.inetserver.iis.security: RE: dcomcnfg.exe interactive user vs launching user  
any ideas.

2)<http://support.microsoft.com/?kbid=257757>

secondly i have read in this article that server side automation can show up some dialog boxes some times which may cause your application to hang. now my question is .. is this applicable even when you have 'interactive user' selected in docmncfg.exe. in other words these dialog boxes would show up only when 'this user' or 'launching user' is selected in docomcnfg.exe or it is equally applicable when 'interactive user' is selected.

Thanks
