Hi Brian,

The 403.3 indicates that you have not allowed write access to your directory and the 403.5 tells us that someone is trying to access your site with a client certificate that isn't using 128bit encryption.

403.3 – Write access forbidden.

403.5 – SSL 128 required.

If you are trying to use anonymous authentication make sure your IUSR account isn't locked out, and that your passwords are synced.

Best regards,

Jason M. Murray [MSFT]

|  
| My IIS 6 on Server 2003 worked fine for a month. Then,

microsoft.public.inetserver.iis.security: RE: Access requires password

| all of a sudden, it began prompting for a user ID and  
| password and no id password combinations worked,  
| including the admin.

|  
| The system had not been touched for 3 days prior to this  
| beginnning to happen. The logs show a 403.3 and 403.5  
| errors when trying to access the site.

|  
| I have checked NT settings and all the settings on IIS  
| necessary to get it going, to no avail. In the process, I  
| changed teh password on IUSR\_computername on NT and the  
| IIM manager.

|  
| Any sugestions would be appreciated. Norton has not  
| detented any virus on this machine.

|  
| Thanks.  
|
