By default IIS 6.0 only serves statics HTML pages. If you are just serving out static pages, there should not be any problem with IIS 6. If you are running custom apps like ASP/CGI etc, you may need to specifically enable the options to run them . Otherwise, try setting IIS6.0 to run in IIS 5 isolation mode and see if it resolves the issue. If it does, the problem is probably related to the architecture change in IIS6.0 (http.sys and worker process concept)

Some Additional Information for your reference when using IIS 6.0 Worker Process Mode:

1. In Microsoft Internet Information Services (IIS) 6.0, when a request contains a header name that includes a question mark (?) character or another separator character, Http.sys rejects the request and sends the following error message to the requestor:

Bad Request (Invalid Header Name).

Additionally, when you use lowercase HTTP verbs like "get," Http.sys rejects the request and sends the following error message to the requestor:

"Bad Request (Invalid Verb)".

Refer to the KB for resolution/workaround:

FIX: Http.sys Rejects Requests That Contain Separator Characters
<http://support.microsoft.com/?id=828726>

2. KB: Information about ISAPI filters with SF_NOTIFY_READ_RAW_DATA in IIS 6.0
<http://support.microsoft.com/?id=311852>

3. Error Message: HTTP/1.1 Error 400 – Bad Request
<http://support.microsoft.com/?id=247249>

Hope it helps
Desmond
