Hi John,

I am not sure which version of IIS you use so these answers is for latest IIS (IIS 6 that comes with Windows 2003 server).

If you setup virtual directory, you have an option to not require SSL on Default Web Site and just require it for your virtual directory. If user will enter <http://localhost> this will work and so will <https://localhost>. IIS will not require user to switch to https...

Now right click on your virtual directory -> properties -> directory security -> click Edit button under Secure Communications and select Require secure channel (SSL). Any user accessing http://localhost/virt_dir will be notified that he/she must use https://

For SSL redirections try solutions provided in these Microsoft articles:

How to: Redirect an HTTP connection to HTTPS for Outlook Web Access (OWA) in Exchange 2003 Server.

<http://support.microsoft.com/default.aspx?scid=kb;en-us;555126>

HOW TO: Use ASP to Force SSL for Specific Pages

<http://support.microsoft.com/default.aspx?scid=kb;en-us;239875>

If these redirection won't work for you let me know, there are few other options...

I hope it helps,

Mike
