I am trying to access the HelloWorld method compiled in one project using a consuming C# code-behind method compiled in a separate project.

Both run on localhost. The test drivers provided in Visual Studio .NET 2003 can invoke the method.

When I attempt to add a web reference in the consuming project for the webservice I get the error message ...

Configuration Error

Description: An error occurred during the processing of a configuration file required to service this request. Please review the specific error details below and modify your configuration file appropriately.

Parser Error Message: It is an error to use a section registered as allowDefinition='MachineToApplication' beyond application level. This error can be caused by a virtual directory not being configured as an application in IIS.

Source Error:

Line 43: by Microsoft that offers a single logon and core profile services for member sites.

Line 44: --->

Line 45: <authentication mode="Windows" />

Line 46:

Line 47: <!-- AUTHORIZATION

Can you give me some guidance on how to correct this condition to permit me to establish the reference to the webservice?

After I see this simple (first) case, I will be able to attack the "real" project.

If there is a better newsgroup for my question, please let me know.

(Yes I do have administrator on privileges on this machine and access to IIS configuration.)
