That error means that you made a request for a URL that ends with a / (hence telling IIS to look up a default document to serve back), but you did not have a file that matches the defined Default Document at that URL.

In other words, if you made a request to <http://1.2.3.4/vdir/> and that vdir defined Default.htm and default.asp as default documents, you did not have default.htm nor default.asp at the physical directory corresponding to /vdir

This should reproduce regardless whether you are accessing the URL from home or at work, so you have something else going on here. What you describe is not possible with a single IIS website definition which includes both the LAN and WAN IPs.

So, you either have two websites, one bound to LAN IP and the other to WAN IP, or networking is wrong where you are somehow not accessing the same machine when requesting the LAN or WAN IP. In either case, the problem has nothing to do with permissions and everything to do with user misconfiguration.

Hi,

The Anonymous access on the directory security is enabled.

Under IP Address and domain name restriction, currently it is setup for

By default, all computers will be : Granted access

Actual error message after switching off "Show friendly HTTP Error Message", the error message is this :

Directory Listing Denied

The Virtual Directory does not allow contents to be listed.

Let me know if i need to check any other security on web server.

Regards

Bhavesh
