Good day:

I am running a dual processor on standalone server, Windows 2003 SP1 and all the hot fixes, The only application is running on this server is, IIS6, FTP and SQL 2000.

I have the same problem with the server it stop working every night is real frustrating

This is the error in the event log

```
Warning: IIS log failed to write entry, File
/LM/W3SVC/766998546/Root/global.asa Line 10 Operation is not allowed
when the object is open..
```

```
Warning: IIS log failed to write entry, File
/LM/W3SVC/766998546/Root/global.asa Line 10 Object required: 'conn'.
```

I have searched for this file in the Inetpub folder but I got over 50 global.asa files

I have looked at the posted fix, Truly I did not understand where do I make the change, is it in the registry? I think it is referring to AD, Domain and GPO issues but this server is standalone and never been part of domain.

I would appreciate any help many thanks in advance.
