Hello Ken,

the entries in the logfile are:

\*\*\*\*\*

```
2006-02-13 16:42:08 W3SVC1 10.230.31.1 GET /general/unblock.xml - 80 -
10.231.11.12 Mozilla/4.0+(compatible;+MSIE+6.0;+Windows+NT+5.0) -
server.domain.com 401 2 2148074254 2540 318
```

```
2006-02-13 16:42:08 W3SVC1 10.230.31.1 GET /general/unblock.xml - 80
DOMAIN\USER 10.231.11.12
Mozilla/4.0+(compatible;+MSIE+6.0;+Windows+NT+5.0) - server.domain.com
200 0 0 0 2273
```

```
2006-02-13 16:42:08 W3SVC1 10.230.31.1 GET /general/unblock.xml - 80 -
10.231.11.12 Mozilla/4.0+(compatible;+MSIE+6.0;+Windows+NT+5.0) -
server.domain.com 401 1 0 2443 2273
```

\*\*\*\*\*

As you can see, the first and third request produce a 401, request number is fine – but why do I get the authentication window?

Thank you

Tim

Can you please post the IIS logfile entries here please?

Thanks

Cheers

Ken

: Hi all,

:

: I have the following constellation:

:

: Windows 2003 Server with IIS and integrated windows authentication as  
: the only authentication method

:

: When I request a page like <http://myserver.com/file.html>, it works fine  
: with a Windows 2000 client (on the server I can log the requesting  
: user, just the way it should be).

:

: When I request the same page with the same user from a Windows XP  
: client, I get the requested content in the browser window AND a dialog  
: window which asks me to enter username and password

:

: In the IIS logfile I can see that the Windows XP client generated three  
: requests, one without supplied credentials, the next one with them  
: (this can happen as the IIS tells the Internet Explorer to send the  
: same request again after the first one, but this time with  
: credentials), and the third request without credentials again.

:

: The HTTP codes are 401 for request 1, 200 for request 2 and 401 again  
: for request 3.

:

: I don't understand why there are three and not two requests, and I  
: don't know why the browser displays the required content AND the dialog  
: box as well.

:

: I tried to enable / disable "use integrated windows authentication" in  
: Internet Explorer, but neither of the settings changed anything.

:

: I really don't have a clue what might be wrong, any help is very  
: appreciated.

:

: Best regards

:

: Tim
