So, is IE6 able to login against these same machines, while simultaneously IE7 cannot?

And is this an Intranet or Internet scenario? Because that affects the viability of Integrated Authentication.

In IE Options, there is a checkbox called "Enable Integrated Windows Authentication" – if your Intranet uses Kerberos, make sure it is checked. Otherwise, it will be using NTLM.

Dave wrote:

Hi all,

Why is IE7 unable to login to our IIS websites? We've employed the same configuration on our web servers for seven years now and never experienced such a severe incompatibility issue with a web browser.

Our IIS configuration is as follows:

- Version: IIS 5
- Platform: W2KAS SP4
- SSL: none installed
- Anonymous Access: enabled
- Basic Authentication: disabled
- Digest Authentication: disabled
- Integrated Windows Authentication: enabled

Very straightforward. We have chosen these settings for their cross-browser compatibility whilst allowing web directory security via NTFS permissions.

Re: IE7 Cannot Login!

Again, this has worked flawlessly for seven years.

Needless to say, our support phones are ringing off the hook with, "my password isn't working." It's hard not to laugh when telling our customers that Microsoft's latest web browser is incompatible with Microsoft's own web servers. :-D

Any help is greatly appreciated.
