I tried already using `Registereventsource()` and `Reportevent()` functions given in the MSDN. The `Registereventsource()` function not returning the handle of securitylog. It is giving error codes 5 and 6. It is not possible to write in the securitylog event though i am having administrator privileges. I want to write events into the securitylog for local and remote systems. I am using the windowsxp. I know the functions which works only in Winnt systems. Those are `authzregistersecurityeventsource()` and `authzreportsecurityevent()`. I want any other way to write events into the security log. Because i must write events into the security log of local and remote systems. Please help me.
