

De-louse NTFS without starting OS

Is it possible to boot a machine with W2k to a prompt and from there run an antivirus scan of an NTFS partition?

My own computers all have FAT and FAT 32 partitions and with those I can boot from a CD and run a Dos version of F-prot.

Now a female friend says she has been infected with some virus, despite having F-secure realtime protection, and she has seen a message/warning telling her that her hard drive is about to be wiped.

On seeing that warning she phoned her brother who is a computer pro and he has advised her not to touch the machine until he comes to town, in some three weeks!

Any suggestion appreciated.
