Having my first computer for 2 months now, I don't know much about RAM and ROM other than – the more , the better. So when I looked at this Taskinfo program, I interpret it saying that I need more RAM!

At the top of the screen it said: RAM Usage 99%, Virtual Memory Usage 18.39%, In ROM and not touched pages 18.10%, and In Swap File 0.30%.

But after you said that high Idle is good, then I guess that I can relax because my Idle is 95.47%.

The top three memory using programs are: Internet Explorer 22MB
Windows
Explorer 11MB
Symantec
Session 9MB

The percent number on the Taskinfo taskbar button hovers around 5% then shoots to 20% at times.

Everything is probably normal. I just don't know what I'm seeing.
