What happened when you ran your antivirus program?

i have a virus that doesn't activate until i update my computer. i've only had it happen twice, so i can't be sure, but the first time was when i updated norton to 2005 and downloaded all of the updates, and then reboot like it said. then it would load to the login screen, and as soon as i logged in, it would restart. after a while of trying different things, i had nothing else to do except do a system restore. then i decided to try to update my computer from service pack 1 to service pack 2, and after all of it downloaded, i reboot. then it would try to load to the login screen, and constantly restart, so i had to do another system restore. is there a way to fix my computer, or am i going to have to get a new one (or not update my comp and just use it as it is)?
