Thanks for explanation. On the side – both: GUI and command line (which I tried too) in a Safe Mode are limited (in my trials, at least). They can't do the first step (I don't remember – check memory or something else). They work in full in Normal Mode, however.

| PS. I understand. Often I have a bad day too...

The Sophos Command Line Scanner uses Signature and Heuristics detection to find and remove infected files.

Anti-RootKit utilities look through known areas of system and Registry for Rooted types of Trojan infection vectors and list them as possibilities. It takes a knowledgeable interpretation to understand the results of such utilities. They are NOT

Re: SOPHOS found...

for novices.

Please do NOT equate the Sophos anti-RootKit utility with the Sophos command line scanner.

They are as different as night and day.
