I need a somewhat transparent way (to user) to restrict the hours my son can log on to our home pc. He is 16 with a good working knowledge of PCs and a large capacity (and desire) to hack his user settings. We are running windows 2000 professional, single PC (no longer attached to network but PC identification still set on the workgroup it was previously assigned to), and he is on the Power User setting. I read a MSDN article that says you can't restrict user hours in a workgroup environment on the win2k environment. I tried changing the id, but computer wouldn't log on to internet (??) so changed it back and no problems. A.) Is there a work-around to this? (NOTE- computer management console waaaaaaay confusing so need good instructions if I need to work in this utility) B.) Are there any other parents out there who have found good ways to restrict usage aside from log on hours?

Signed,

Desparate Mom in Florida with Urgent Need to Raise Son's GPA (thanks a million)
