Can anyone please help with the following: I am trying to get a remote client to connect to a w2000 server, using Cisco VPN Client 3.5.3, and windows 95 o/s, and although it installs ok, when you try to run the vpn dialler (after creating a profile), the following message appears: "the necessary vpn sub-system is not available. You cannot connect to the remote vpn server";

The identical setup on a w2000 machine works perfectly, though; Can anyone help??

Thank you
