You must follow the instructions for running the "fix". One suggestion is to run the fix in the safe mode: reboot and continue to hit the F8 key until the startup option menu appears, pick "Safe Mode" and let the computer finish booting up into the Safe Mode, then run "fixblast.exe" from the Start/Run/Command line. Once it completes, reboot the computer and let it boot up normally into Windows XP. Run fixblast.exe again just to make sure.

Load the MS MSBlaster fix for XP from the Windows Update site, find and load a firewall program and get a good AV program – Norton's is excellent.
