Hello all...

We have a FTP site for our clients to download files from. We could send them a link (such as `ftp://userid:password@ftp.download.com/testdir/testdoc.doc`) and they would click on the link and download the file. This was working great in W2K, but when we upgraded to Win2003 Server, we lost this ability. I believe it is an access rights issue but I cant seem to get this to work without giving the user id file scan rights. This is not an option as the information is client specific.

I have checked the FTP logs for any errors but I see nothing that concerns me. I know I can do this if I pass my domain userid and password (I am a domain Admin)

Thanks...
