Hi, Lucy,

Run a dll as an app is a legitimate Microsoft utility. It can be a lifesaver at times if a programme becomes corrupted. Your firewall might have informed you that "run a dll as an app" was trying to connect to Microsoft, say for example you'd run dxdiag. To that end, there is nothing to worry over.

You do not specify which firewall you are running. You may not be aware that every single Windows application will try to make an outgoing connection when run.

If you can, configure a rule to make all applications run as client not server. The exception to this would be certain chat software which may require both client and server status.

If you are still concerned, post back with the context of the firewall message you refer to. It would be a different matter if perhaps an outside entity had connected to your computer and started "running dlls as apps".

Sadie
