I used showaccs.exe to download file permission rights and use xcacls.vbs to restore those file permissions as in a case of server upgrade. I need to find out what the code sequence are to restore five situations– the first is a folder with just List Folder Contents and Read both checked. The second is a folder with List Folder Contents, Read, and Write checked. The third is a folder with Deny Write checked. The fourth is a folder with Deny Read checked. The fifth is a folder with Deny List Folder Contents, Read, and Write checked.

For example, a folder can be in any given permission set. But, if I use the following command line statement: >cscript.exe xcacls.vbs "D:\TestFolder" /g USERS:X [enter], the folder TestFolder is reset to List Folder Contents, Read and Write boxes checked. The advanced settings will also be reset to the corresponding.
