In article <uDMQYoA\$GHA.4468@xxxxxxxxxxxxxxxxxxxxxx>, in the microsoft.public.security news group, <"smith" <@discussion.com>> says...

Hi, all. I am using Acronis True Image to backup the partitions.

I have created Acronis recovery manager in a hidden partition. If there is serious problem in the system, I can restore the chosen partitions just by pressing only one key a few seconds after system starts. Then should I creat bootable rescue media using CD-R in addition? Can't the recovery image function when the system can not be booted? Thanks.

This has nothing to do with security, nor with a Microsoft product. You should ask your question in an Acronis forum.
