Hi Pedro,

We are using SQL Server authentication and connecting via a DSN to provide project managers the ability to save their MS Project 2000 projects into a SQL Server Database. All users can use the DSN effectively, but they also have the ability to access any project. My need is to grant users access in a way that each user could access ONLY his projects, and wouldn't be able to access other managers' projects.

Then I'm looking at how to properly configure SQL Server rights so people can only access the project data they are allowed to view even though it is in the same database. The ODBC connections are used with SQL-Server authenticated logon.

I already have looked for help at Project 2000 newsgroup and after some discussions, people there indicate me this newsgroup because the issue relates more specifically with SQL Server security.

We use SQL-Server 2000, MDAC 2.6 and Project 2000. Each manager has a DSN configured at his machine, pointing to the same corporative SQL-Server database.

Would it be possible to solve this problem?

Thanks for any help.
