I have tried to audit user access / failed attempts.  
Hoever, with NT Server 4 SP6A and sqlserver7 sp3, the failed attempts do not register in the application log unless I use the check box set to success or all. When these are set only the failed attempts are logged. When set to failed there is no log entry.

Does anyone know if this is a bug or do I have to set the severity level or audit level to something other than than the default. If so how or where is this documented.

Any help would be appreciated, thanks  
Lance B.
