SQL Server 2000

I've created a SQL Profiler trace file with a ton of queries and I use this as a workload file to the Index Tuning Wizard. Every time I run the wizard, I get this message:

"The workload does not contain any events or queries that can be tuned against current database. Check to see that the trace contains valid events or that the SQL script contains valid queries and you are tuning against the right database."

I'm using the SQLProfilerTSQL_Replay.tdf Profiler template to create the trace file.

Any ideas?
