Thank you, Linda.

Let me explain in details what I'm doing now.

With the current settings everything works great. These settings are:

1. Under Properties – Security tab:

Authentication: SQL Server and Windows

Start and run SQL Server in the following account: System Account

(before it was set to SPECIALTY\pafo, and it also worked fine)

2. Under "Edit Server Registration properties":

Connection: Use Windows authentication

The error occurs when I change it to "Use SQL Server authentication" and put "sa" or any other account. When I click "OK", I get this:

"SQL Server registration failed because of the connection failure displayed below. Do you wish to Modify anyway?
Login failed for user 'sa'"

In my home computer that is not a member of a domain I didn't have any problems changing authentication. I don't know though whether this has anything to do with the domain.

Thank you,

Peter Afonin
