I add a new user and give him DB rights in specific databases. The user works for a few weeks within each database then they will come in one day and will have lost rights in a couple of the databases that they had rights in the previous day. I haven't touched their security settings at all. The user has no way to mess with the security settings. But, sure as day, they are unable to work in a specific DB because they no longer have rights in that DB. The users rights were originally added programmatically. When they lose their rights unexpectedly, I go back and add the security back using EM. A few weeks later, the whole cycle starts over again with that same user. It's become a continuous job giving users their rights in databases where they have lost their rights... fun fun. I Can't establish any pattern... seems to be random to me. Can anyone shed some light?? thanks
