We recently moved SQL Server 2000 to another machine keeping IIS-5.0 on old machine. Both are on W2K. I am using ODBC system DSNs to point new database. When I tried to test one of my ASP page I got this problem.

Microsoft OLE DB Provider for ODBC Drivers error '80004005'

[Microsoft][ODBC SQL Server Driver][SQL Server]Cannot open database requested in login 'DataBaseX'. Login fails.

/ASPPage.asp, line 11

My code looks like:

```
set cn = server.CreateObject("ADODB.Connection")
cn.ConnectionString="DSN=dsnX"
cn.Open
```

When I saw on the SQL server only dbo user is assigned to 'DataBaseX' database.

If I write this same code in a VB component then it works fine. I don't understand why this is not working from a ASP page

I have tried to assign IUSR\_Machine to SQL server database, but no luck. But when I give NT Authority\Anonymous Login then it works from both VB and ASP. My manager don't wants to give NT Authority\Anonymous Login access to databases for security reasons. (this is not safe?)
