About a year ago, I submitted a bug to Microsoft SQL Support. After a short time, I was told that this was an bug and Microsoft would build a hotfix.

See: <http://support.microsoft.com/default.aspx?scid=kb%3Ben-us%3B319212>

The instructions from Microsoft (below) led me to believe that applying any service pack or security fix would undo this hotfix that is mission critical to our datacenter.

The package includes a README.TXT with details about how to install the hotfix. This fix requires that SQL 7.0 SP3 already be installed on the server. We are beyond the cutoff date for fixes to make it into SP4 (currently in beta), so this fix will also be addressed in a post-SP4 QFE rollup build to be released after SP4. In other words, when SP4 comes out, don't apply it until you have the SP4 QFE rollup build because SP4 itself will not include this fix.

Does anyone know if the SP4 QFE build exists yet or if I can apply SQL 7 security fixes without breaking my hotfix? This is not something I can easily test because the hotfix fixes a production problem when the server is under a heavy load.

Thanks
