Hi,

It seems that I'm not the only one having this problem of CSRSS.EXE eating 100% CPU time after installing SP3. I've encountered this problem on XP SP1 with SQL Personal Ed, although a recent post from Brig implies that it affects installations running on W2K Server as well.

MS, are you investigating this? Am I the only one who's starting to think SP3 was released a tad early, and would have benefited from a bit more testing perhaps? Maybe a Service Pack for SP3 will be along soon.

Is there any point in hanging around for a helpful response from MS, or should I just cut my losses now and reinstall SQL Server with SP2???

Regards,
Alex Clark

(Daniel Bright, Jasper, and Brig are three other NG members that have reported the same error. I suppose potentially there could be more people with the same problem, who can't even post a NG message because their CPU is being swamped by CSRSS.EXE)
