Trying to install Project Server for the first time and setup stops with the message 'The specified MSProjectServerRole account is not in the MSProjectServerRole role'. The user/account that I've used is the only user in the role and for SQL Server has roles of System Administrator, Security Administrator and Database Creator and has access (only) to the project database. In the project database the user has permissions for public, db_accessadmin, db_securityadmin, db_ddladmin, db_datareader, db_datawriter and MSProjectServerRole.

What else do I have to set up to make this work??

Thanks

David
