Hello, Francis!

Read these in BOL

Database Owner (dbo)

CREATE TABLE

owner

Is the name of the user ID that owns the new table. owner must be an existing user ID in the database specified by database\_name. owner defaults to the user ID associated with the login for the current connection in the database specified in database\_name. If the CREATE TABLE statement is executed by a member of the sysadmin fixed server role, or a member of the db\_downer or db\_ddladmin fixed database roles in the database specified by database\_name, owner can specify a user ID other than the one associated with the login of the current connection. If the CREATE TABLE statement is executed by a login associated with a user ID that has only create table permissions, owner must specify the user ID associated with the current login. Members of the sysadmin fixed server role, or logins aliased to the dbo user are associated with the user ID dbo; therefore, tables created by these users default to having dbo as the owner. Tables created by any logins not in either of these two roles have owner default to the user ID associated with the login.

: I know it is possible because it was doing it before but

: something changed and I don't know what.

: I saw that there is a dbo user associated to the database.

: Can I associate my user to it ?

: Francis.
