I'm very new to this SQL Server 2000 computing. I coded a job that runs in a schedule. The first step executes a .bat file that deletes and renames a couple directories. It is failing with the error below. Any help would be greatly appreciated. Also, where is there error interpretation documentation?

Executed as user: ADAM\SYSTEM. The process could not be created for step 1 of job
0x66BF98AC7F80FA49A4958CB1A3B87386 (reason: The system could not find the environment option that was entered).
The step failed.
