Found it ! Apparently it was not related to sa or sa-settings but it had all in the nt-authentication for my default connection setting.

"EXEC master..xp_logininfo @acctname = 'domain\dbadministrator',@option = 'all' " produced two lines of output.

```
account name type privilege mapped login name
permission path
domain\dbadministrator user admin domain\dbadministrator
domain\dbadmins
domain\dbadministrator user user domain\dbadministrator
server\localappsgroup
```

I didn't expect to be member of server\localappsgroup. The "server\localappsgroup" has default database "fabrdb". This causes this "strange?" behaviour. I'll check out this group-membership.

Thanks for your support.
