Hi,

I am connecting to a SQL Server database with a Data Access Page which contains a Workflow Toolbar Control. While deploying the data access page in other machines, i am getting the error "Data Provider could not be initialized" and "Login failed for user (null). Reason: Not associated with a trusted SQL Server connection" on load of the page. The user who is trying to access is a valid Active directory User who has also been added into the SQL database users list under a particular role. How do i resolve the problem? I have checked out the solutions over the internet and did not find them helpful enough. I tried to change the UseRemoteProvider property to true and then received the "Internet Server Error" on load of the page. However if i load the data access page on the machine where the SQL Server exists, it is working fine. Any help towards this would be greatly appreciated. Thanks in advance.

Thanks and Regards,  
Vikas Haridas
