Hi Benjamin,

Could you post the detailed error message when executing the stored procedure in ASP.NET? We can use Profiler to capture the SQL Server trace and see under which user the stored procedure is executed. If you login as that user in Query Analyzer and executes that stored procedure, will the problem occur?

Is the error thrown by the stored procedure or the SQL Server 2000? If the error is thrown by the stored procedure, could you post the code of the stored procedure?

Bill Cheng

| Hello all,

|

| I am having a strange issue, I am running an ASP.NET site, with
| MSSQL2k back end. All but one of my procedures execute fine, and with
| no errors. But one procedure in particular raises the Login failed
| for user 'foo' error. The funny thing is, the procedure inserts
| correctly.

|

| I explicitly added permissions to access the table and the procedure
| to the user, even though the user is in the db_owner role. I am doing
| a SELECT @@IDENTITY at the very end, but that hasn't caused me
| problems in the past. any ideas anybody?

|
