Hi !

This Mark Vergara Programmer from Comtech Solutions

We have been creating a user login with no default server role this means that the user we been created has no rights to do some database task, we try to login the user we been created and try to changed the password and it returns the error

"Only members of the sysadmin role can use the loginame option. The password was not changed."

So is there any possibel way to change the password w/o setting the Server to System Administrator or to Security Administrator

Can you offer any advice to me?

Thanks,

Mark
