I am attempting to setup up a linked server from my production server (sql1) to my reporting server (sql2). I have replication from sql1 to sql2.

I noticed that there is already a remote server setup on sql1 for sql2. It will not allow me to setup a linked server for sql2. Plus, I am unable to run a distributed query... I get the error message that the remote server is not configured from data access.

How do I setup a linked server from sql1 to sql2 so that I have data access?

Please advise..

Thank you,  
Brett

I am using SQL Server 2000 for my production and reporting servers.
