We are receiving the error "Logon failed for user '(null)'. Reason: Not associated with a trusted SQL Server Connection".

We have a WinForms application written in VB.NET 2003 and connect to a SQL Server 2000 (SP3) DB with the following connection string:

```
gstrConn = _  
    "Server=SQL2000;" & _  
    "DataBase=dbname;" & _  
    "Integrated Security=SSPI;"
```

The application works perfectly for the users on one network domain, but the error listed above appears when trying to access the DB application from a user's workstation on another domain. The user has a SQL Server account. We have even tried to have the user run the DB application in a smart client "trusted assembly" environment but also get the error. What must be configured differently and how?

A poor state employee–
