previous post:

"I am not able to start SQL profiler as well as SQL Query Analyzer by simply double clicking it. I have to explicitly run it under current user account... Initially I was not able to access any Profiler template files saved under Desktop, then I granted rights to the logged in Domain user... Now it is able to access the files but could not start trace..."

Please explain what account you're logging into the machine with.
What groups does this user belong to?
Are there any Group Policies loaded ?
Also, did you create new desktop shortcuts to Profiler and Query Analyser?
Do the programs run if you launch them from the menu as opposed to your shortcuts?

Thanks,
