I've got 2 servers running sql server 2000 enterprise edition. The prod server has operating system windows nt 5.0 (2195) and product version 8.00.534 (SP2). The test server has the same operating system and product version 8.00.760 (SP3). When I run the sp_revokedbaccess procedure in the test system, I get the following error message: Procedure sp_revokedbaccess expect parameter @error which was not supplied. – regardless if I run using query analyzer or try to delete the user in the database directly. This procedure works fine on the prod server. When I compare the code for sp_revokedbaccess from the test to prod server, the code is obviously different but I have been unable to find any references to bugs/fixes from microsoft, including the latest SP3A release, for the sp_revokedbaccess procedure. Has anyone else experienced this problem or do I need to contact microsoft directly?
