Thanks Tom. That did exactly what I wanted.

Add them to the db\_ddladmin role.

news:#90I7Z7zDHA.2116@TK2MSFTNGP11.phx.gbl...

I have a group of developers that I want to allow permissions to  
create/alter table structures in a particular database. I don't want to give  
them rights to alter the database itself just rights to alter the structures  
inside the database. I run the following command in the query analyzer  
connected to the development database:

```
GRANT CREATE TABLE TO DevAdmin
```

DevAdmin is a Windows 2K Group containing the developers. We are running SQL  
Server 2000.

When I have one of the devlopers open Enterprise Manager and check the  
permissions on a table in the development database the design option is  
still grayed out. How can I accomplish allowing the devlopers to change the  
structure of tables, views, etc...without giving them db\_owner rights and  
without allowing them to alter the database itself?

Thanks.

Nancy
