Hi,

Second attempt to post this same message (yesterdays post is not to be found in this forum ???).

I like to retrieve ALL permissions on all objects for each user (each role, each login) in ALL of the databases within one server environment. I tried the standard "sp_" procs but they are too limited for this.

I have to deal with approx 250 databases on approx 60 servers so I like to have something which I can use on server level and not on table level (like the standard procs).

As an Oracle DBA I'm not that familiar with scripting on SQL server 2000 so I need your help on this one.

who can help me out?

Thanks in advance,

Regards, GKramer
