we got sql2000 dump from a customer and we can't run against it because, for some reason, the users in our database don't have associated logins (as seen in sql enterprise mgr >> db >> users >> login name column). In all other databases the users of our database have the sa login associated with them.

the users screen in a working db has 3 columns: name (e.g. dbo), Login Name (e.g sa) and Database Access (e.g. Permit).

in this same screen in the database we can't upgrade/run against the login name is blank for the dbo user...

any way i can reassociate the sa login w/ this user?

Thanks in advance,

Russ White
