How do people use SQL in Win authenticated mode only?

Excuse the naive question but how do people use SQL without allowing SQL logins? I ask because I've hit a problem today with all of my jobs failing with:

"Unable to determine if the owner (domain\username) of job testjob has server access (reason: Could not obtain information about Windows NT group/user 'domain\username'"

I looked at the KB article <http://support.microsoft.com/default.aspx?scid=kb:en-us:241643> and it says set them a SQL user. They were running as my user (NT login member of sysadmin group). So how could I get around this is if I didn't have any SQL logins. I've never tried Win Auth only so not sure I'm probably missing something obvious. Also, isn't the double hop authentication issue a pain in the backside if you only have NT logins?

Ta
DaveK
